

Thaka Thok Water Delivery App

README Version: v1.2

Thaka Thok Water Delivery App is a complete water plant delivery management system developed for managing customer orders, pending payments, empty jar/can returns, delivery staff updates, admin approval, and delivery workflow in one centralized platform.

Project Modules

1. Customer Mobile App
2. Admin Dashboard
3. Delivery Staff Panel
4. Backend API
5. Database Setup
6. Deployment Setup
7. Documentation & Handover

Main Features

Customer App

- Mobile OTP login
- Customer profile management
- Water jar/can order placement
- Order status tracking
- Pending payment visibility
- Pending empty jar/can visibility
- Next order restriction if previous dues or cans are pending

Admin Dashboard

- Customer management
- Delivery area management
- Product/rate management
- Order management
- Delivery staff management
- Pending payment tracking
- Empty jar/can tracking
- Monthly dues report
- Customer-wise order/payment history
- Admin "All Done" approval process

Delivery Staff Panel

- Delivery staff login
- Assigned order visibility
- Delivery status updates
- Payment collection update
- Empty jar/can return update
- Route/order visibility
- Daily delivery workflow

Phase 1 Aadhaar Number Duplicate Check

- Aadhaar number-based duplicate check and pending dues tracking for water delivery
- No Aadhaar eKYC/API integration involved
- If a customer registers again with another mobile number but the same Aadhaar number, previous pending dues and empty can records will remain linked
- Customers with pending dues or pending empty cans cannot place another order until previous records are cleared and verified
- Codebase will be multi-branch ready. Future branches can be added from the Admin Panel without code changes for the standard branch setup.
- Basic branch creation and management will be planned in the code structure.
- Any future advanced branch-specific custom feature, separate workflow, or major customization will be handled separately if required.

Technology Stack

- Mobile App: Flutter
- Admin Dashboard: Web-based dashboard
- Backend/API: Secure backend architecture
- Database: Structured database for customers, orders, payments, cans, staff, and reports
- Hosting/Deployment: Client-owned AWS account as discussed
- Repository: Client-owned GitHub repository

Milestone 1 Target

The first testable version will target Customer Login, Order Flow, SMS/OTP setup, Branch Filter, and Combined Reports within 7-10 working days from payment confirmation and required access/API details shared by the client side.

Development Start Condition

The official project development start date will be counted from the date of advance payment confirmation/UTR receipt and required access/API details shared by the client side.

Any timeline, milestone delivery period, weekly review cycle, and active development work will begin only after the advance payment is received and confirmed.

Review Process

Weekly review calls will be planned every Friday at 4:00 PM once development starts.

SMS/OTP DLT Setup

Jio DLT can be used for SMS/OTP configuration with Fast2SMS after approval. The required details from the client side are Entity ID, Header/Sender ID, and Template IDs.

Project Status

Initial project setup and documentation commits have been created. Full development will officially start after advance payment confirmation/UTR receipt and required access/API details are shared by the client side.
